Ways to diminish
WATER
consumption

*"Not only necessary to life, but rather life
itself; of the riches that exist in the world,
thou art the rarest and also the most
delicate and...pure! "*

Antoine de Saint-Exupéry

You can install a special device to the kitchen or bathroom tap that will introduce air bubbles in the water flow; you won't feel the difference but the water consumption will decrease with 20%.

Avoid water loss! A tap that drips means about 17 litres of wasted water per day.

To water the plants, take advantage of the morning and evening coolness! Thus, the evaporation is reduced and plants will need less water.

If you have a big garden, plant trees to have shade and to avoid evaporation! Thus, you avoid water loss.

Collect rain water so that you can use it later to water the plants or your garden!

When you brush your teeth, turn off the tap!

Choose to have a shower not a bath! The tap water is pumped with energy, a medium shower consumes 160 litres while a full bath 350 litres, taking also into account the energy used to warm the water.

Check also the shower hose so that it doesn't drip; otherwise the debit of water decreases!

Load the washing machine or the dishwasher at full capacity!

Don't let the water flow until it cools, you had better fill a bottle and put it in the fridge! Thus, you will get cold water faster.

Buy household devices with low energy consumption!

Wash the fruits and vegetables in a bowl filled with water, not directly under the water jet!

Defrost the food putting it in the fridge and not under the water jet!

Wash your car using a bucket and a sponge! You will save a lot of water, taking into account that automatic washing needs 32 - 100 litres.

Wash your car early in the morning or in the evening to avoid water evaporation due to high temperatures!

Use water wisely!

If we use water efficiently,
the water resources will be
here for the next generations
as well.

Water is life!
